

Server Room Solution

Protect the most sensitive areas of your organization

One of the most sensitive locations in any organization is its Server rooms - the place which stores the company's most valuable data and computerized equipment.

Synel is implementing a special solution which grants extra security to Server rooms in the organization.

Over and above controlling the entrance to the room, the system controls door opening in Server cabinets, and entry is possible only by fingerprint or badge identification.

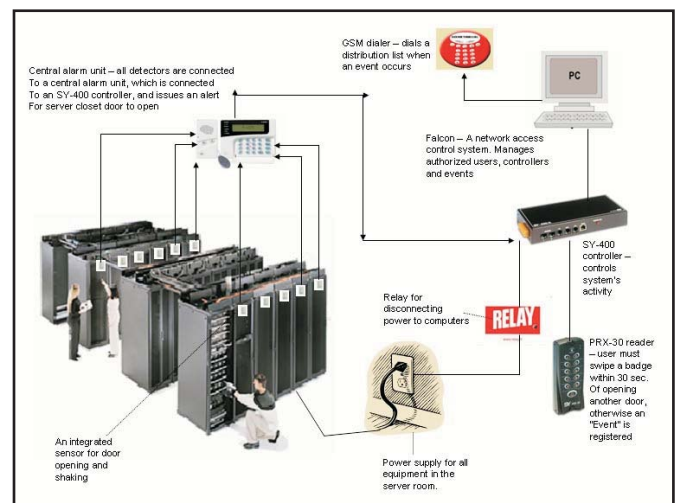

By using an electrical magnet attached to the cabinet door, an alert is received on a cabinet being left open and the duration of the time it has been left this way. In case of unauthorized entry attempt or door been left open, an alert is sent to the security department either via SMS, e.mail or a pop-up window. In addition, a GSM dialer will dial a pre-defined distribution list, which will receive a recorded message informing of the event.

Upon receiving an alert of an event, the system will activate a camera from within the access control system, which will record and store the event for future viewing and analyzing.

The system includes SY-400 controller which is connected either to a proximity or fingerprint reader via Falcon PRO access control software.

Benefits

- **Improve security in sensitive areas of the organization**
 - **Enable versatile entry definitions, i.e. only two people can be present in the room at any given time**
 - **Online alert to IT manager or security officer on unauthorized entry**
 - **Registration of who visited the room and when**
- With the option of I/O expansion additional alerts can be given, such as environmental conditions and changes: temperature, humidity, air pressure, and more....**

Access Control
